The Moving-Average Method

The moving-average method is not only useful in smoothing a time series to see its trend; it is the basic method used in measuring the seasonal fluctuation . In contrast to the least squares method, which expresses the trend in terms of a mathematical equation ( $\left.Y^{\prime}=a+b t\right)$, the moving-average method merely smooths the fluctuations in the data. This is accomplished by "moving" the arithmetic mean values through the time series.

To apply the moving-average method to a time series, the data should follow a fairly linear trend and have a definite pattern of fluctuations (repeating, say, every three years). The data in the following example have three components-trend, cycle, and irregular variation, abbreviated $T, C$, and $l$. There is no seasonal variation, because the data are recorded annually. What the moving-average method does, in effect, is average out $C$ and $I$. The residual is trend.
For example, in the following time series the cycle repeats itself every seven years, and the amplitude of each cycle is 4; that is, there are exactly four units from the trough (lowest time period) to the peak. The seven-year moving average, therefore, averages out the cyclical and irregular fluctuations perfectly, and the residual is a linear trend.

| Year | Sales <br> (\$ millions) | Seven-Year <br> Moving Total | Seven-Year <br> Moving Average |
| :---: | :---: | :---: | :---: |
| 1980 | 1 |  |  |
| 1981 | 2 |  |  |
| 1982 | 3 | 22 |  |
| 1983 | 4 | 23 | 3.143 |
| 1984 | 5 | 24 | 3.286 |
| 1985 | 4 | 25 | 3.429 |
| 1986 | 3 | 26 | 3.571 |
| 1987 | 2 | 27 | 3.714 |
| 1988 | 3 | 28 | 3.857 |
| 1989 | 4 | 29 | 4.000 |
| 1990 | 5 | 30 | 4.143 |
| 1991 | 6 | 31 | 4.286 |
| 1992 | 5 | 32 | 4.429 |
| 1993 | 4 | 33 | 4.571 |
| 1994 | 3 | 34 | 4.714 |
| 1995 | 4 | 35 | 4.857 |
| 1996 | 5 | 36 | 5.000 |
| 1997 | 6 | 37 | 5.143 |
| 1998 | 7 | 38 | 5.286 |
| 1999 | 6 | 39 | 5.429 |
| 2000 | 5 | 40 | 5.571 |
| 2001 | 4 | 41 | 5.714 |
| 2002 | 5 |  | 5.857 |
| 2003 | 6 |  |  |
| 2004 | 7 |  |  |
| 2005 | 2 |  |  |

The first step in computing the seven-year moving average is to determine the seven-year moving totals. The total sales for the first seven years (1980-86 inclusive) are S22 million, found by $1+2+3+4+5+4+3$.

The total of $\$ 22$ million is divided by 7 to determine the arithmetic mean sales per year. The sevenyear total (22) and the seven-year mean (3.143) are positioned opposite the middle year for that group of seven, namely, 1983.

Then the total sales for the next seven years (1981-87 inclusive) are determined. (A convenient way of doing this is to subtract the sales for 1980 (\$1 million) from the first seven-year total [ $\$ 22$ million] and add the sales for 1987 ( $\$ 2$ million), to give the new total of $\$ 23$ million.) The mean of this total, $\$ 3.286$ million, is positioned opposite the middle year, 1984. The sales data and seven-year moving average are shown graphically in The above table

# Question: Find the three- year and five year moving average? 

|  |  |
| :---: | :---: |
| Year | Production, |
| 1987 | 5 |
| 1988 | 6 |
| 1989 | 8 |
| 1990 | 10 |
| 1991 | 5 |
| 1992 | 3 |
| 1993 | 7 |
| 1994 | 10 |
| 1995 | 12 |
| 1996 | 13 |
| 1997 | 15 |
| 1998 | 18 |
| 1999 | 15 |
| 2000 | 11 |
| 2001 | 14 |
| 2002 | 17 |
| 2003 | 22 |
| 2004 |  |
| 2005 |  |

|  | Production, <br> Year | $\boldsymbol{Y}$ | Three-Year <br> Moving <br> Total | Three-Year <br> Moving <br> Average | Five-Year <br> Moving <br> Total |
| :---: | ---: | :---: | :---: | :---: | :---: |
| 1987 | 5 |  |  |  | Five-Year <br> Moving <br> Average |
| 1988 | 6 |  |  |  |  |
| 1989 | 8 | 19 | 6.3 |  |  |
| 1990 | 10 | 24 | 8.0 |  |  |
| 1991 | 5 | 23 | 7.7 | 34 | 6.8 |
| 1992 | 3 | 18 | 6.0 | 32 | 6.4 |
